

A Categorical Semantics of Signal Flow Graphs

Filippo Bonchi, Paweł Sobociński, **Fabio Zanasi**

CONCUR 2014

Signal Flow Graphs

- Signal Flow Graphs (SFGs) are **stream processing circuits** widely adopted in Control Theory since at least the 1950s.
- Constructed combining four kinds of gate

$$k \in \mathbf{k}$$

Signal Flow Graphs

Two examples:

Both circuits implement the generating function

$$\frac{1}{(1-x)^2} = 1x + 2x^2 + 3x^3 + \dots$$

Signal Flow Graphs

Two examples:

Both circuits implement the generating function

$$\frac{1}{(1-x)^2} = 1x + 2x^2 + 3x^3 + \dots$$

Can we check this *statically*?

Signal Flow Graphs

- In traditional approaches, SFGs are not treated as interesting mathematical structures per se.
 - ⇒ formal analysis typically mean translation into systems of linear equations.
- We study SFGs *directly* as graphical structures.

In this work

A graphical theory of Signal Flow Graphs

- String diagrammatic syntax for circuits.
- **Compositional** semantics.
- **Sound and complete axiomatisation** for semantic equivalence.
 - ⇒ Two circuits implement the same specification if they can be transformed one into the other using the equational theory.

Outline

- Functional circuits

⇒ the signal flows from left to right

- Reverse functional circuits

⇒ the signal flows from right to left

- Generalised circuits

⇒ the signal can flow in both directions

⇒ environment for modeling signal flow graphs

The theory \mathbb{HA} of functional circuits

Functional circuits are the string diagrams generated by the grammar

$$c, d ::= \boxed{\bullet} \mid \boxed{\circ} \mid \boxed{k} \mid \boxed{x} \mid \text{AND} \mid \text{OR} \mid \text{XOR} \mid \boxed{c} \boxed{d} \mid \begin{array}{|c|} \hline \boxed{c} \\ \hline \boxed{d} \\ \hline \end{array}$$

subject to the following equations:

where, for a polynomial $p = k_0 + k_1x + \dots + k_nx^n$, \boxed{p} is

The theory \mathbb{HA} of functional circuits

Functional circuits are the string diagrams generated by the grammar

$$c, d ::= \boxed{\bullet} \mid \boxed{\curvearrowright} \mid \boxed{k} \mid \boxed{x} \mid \boxed{\cap} \mid \boxed{\cup} \mid \boxed{\times} \mid \boxed{c} \boxed{d} \mid \boxed{\begin{smallmatrix} c \\ d \end{smallmatrix}}$$

subject to the following equations:

where, for a polynomial $p = k_0 + k_1x + \dots + k_nx^n$, \boxed{p} is

The theory \mathbb{HA} of functional circuits

Functional circuits are the string diagrams generated by the grammar

$$c, d ::= \boxed{\bullet} \mid \boxed{\circ} \mid \boxed{k} \mid \boxed{x} \mid \text{AND} \mid \text{OR} \mid \text{XOR} \mid \text{CNOT} \mid \text{SWAP} \mid \text{COPY} \mid \text{ERASE} \mid \text{COPY} \mid \text{ERASE}$$

subject to the following equations:

where, for a polynomial $p = k_0 + k_1x + \dots + k_nx^n$, \boxed{p} is

The theory \mathbb{HA} of functional circuits

Functional circuits are the string diagrams generated by the grammar

$$c, d ::= \boxed{\bullet} \mid \boxed{\circ} \mid \boxed{k} \mid \boxed{x} \mid \text{AND} \mid \text{OR} \mid \text{XOR} \mid \boxed{c} \boxed{d} \mid \begin{array}{|c|} \hline \boxed{c} \\ \hline \boxed{d} \\ \hline \end{array}$$

subject to the following equations:

where, for a polynomial $p = k_0 + k_1x + \dots + k_nx^n$, \boxed{p} is

Semantics of functional circuits

- Functional circuits modulo the equations are in 1-1 correspondence with matrices over the polynomial ring $k[x]$.
- Example: check the semantics of  using the equational theory $\mathbb{H}\mathbb{A}$.

Semantics of functional circuits

- Functional circuits modulo the equations are in 1-1 correspondence with matrices over the polynomial ring $k[x]$.
- Example: check the semantics of  using the equational theory $\mathbb{H}\mathbb{A}$.

Semantics of functional circuits

- Functional circuits modulo the equations are in 1-1 correspondence with matrices over the polynomial ring $k[x]$.

Semantics of functional circuits

- Functional circuits modulo the equations are in 1-1 correspondence with matrices over the polynomial ring $k[x]$.
- Example: check the semantics of  using the equational theory $\mathbb{H}\mathbb{A}$.

Semantics of functional circuits

- Functional circuits modulo the equations are in 1-1 correspondence with matrices over the polynomial ring $k[x]$.
- Example: check the semantics of  using the equational theory $\mathbb{H}\mathbb{A}$.

Its semantics is the matrix $\begin{pmatrix} 3x & 6 \\ x & 2 \end{pmatrix}$.

Reverse functional circuits

Reverse functional circuits are functional circuits “reflected about the y-axis”. They are the diagrams generated by the grammar

$$c, d ::= \begin{array}{|c|} \hline \bullet \\ \hline \end{array} \mid \begin{array}{|c|} \hline \text{ } \\ \hline \bullet \end{array} \mid \begin{array}{|c|} \hline k \\ \hline \end{array} \mid \begin{array}{|c|} \hline x \\ \hline \end{array} \mid \begin{array}{|c|} \hline \text{ } \\ \hline \circ \end{array} \mid \begin{array}{|c|} \hline \text{ } \\ \hline \text{ } \end{array} \mid \begin{array}{|c|} \hline \text{ } \\ \hline \text{ } \end{array} \mid \begin{array}{|c|} \hline c \\ \hline d \end{array} \mid \begin{array}{|c|} \hline c \\ \hline d \end{array}$$

subject to equations dual to those of $\mathbb{H}\mathbb{A}$:

The theory \mathbb{HH} of generalised circuits

Generalised circuits are string diagrams generated by the grammar

$$c, d ::= \boxed{\bullet} \mid \boxed{\bullet \curvearrowright} \mid \boxed{k} \mid \boxed{x} \mid \boxed{\curvearrowright \bullet} \mid \boxed{\circ} \mid$$

$$\boxed{\bullet} \mid \boxed{\bullet \curvearrowright} \mid \boxed{k} \mid \boxed{x} \mid \boxed{\curvearrowright \bullet} \mid \boxed{\circ} \mid \boxed{} \mid \boxed{\times} \mid \boxed{c} \boxed{d} \mid \boxed{\begin{smallmatrix} c \\ d \end{smallmatrix}} \mid \boxed{\begin{smallmatrix} c \\ d \end{smallmatrix}}$$

subject to the equations of the theories of functional and reverse functional circuits, plus the following:

The theory \mathbb{H} of generalised circuits

Generalised circuits with feedback loops can be expressed in \mathbb{H}

subject to the equations of the theory of functional and reverse functional circuits, plus the following:

Semantics of Generalised Circuits

Circuits do not generally have a univocal flow direction — a *relational* model is required.

For instance,  ;  σ expresses the diagonal relation.

Semantics of Generalised Circuits

The semantics $\llbracket \cdot \rrbracket$ maps a circuit into a linear relation:

The axiomatisation of \mathbb{HH} is sound and complete

$$\llbracket c \rrbracket = \llbracket d \rrbracket \Leftrightarrow c \stackrel{\mathbb{HH}}{=} d$$

Graphical reasoning in \mathbb{IH}

Check:  and  implement $\frac{1}{(1-x)^2}$.

Proof strategy:

- Represent the two SFGs as generalised circuits

- Represent the specification as a generalised circuit:

$$\sigma \quad \boxed{(1-x)^2} \quad \sigma \cdot \frac{1}{(1-x)^2}$$

- Prove the three of them equal using the axioms of \mathbb{IH} :

$$\text{Circuit 1} = \boxed{(1-x)^2} = \text{Circuit 2}$$

Graphical reasoning in $\mathbb{I}\mathbb{H}$

Check:  and  implement $\frac{1}{(1-x)^2}$.

Graphical reasoning in \mathcal{IHI}

Check:  and  implement $\frac{1}{(1-x)^2}$.

Graphical reasoning in \mathbb{H}

Check:  and  implement $\frac{1}{(1-x)^2}$.

Graphical reasoning in \mathbb{H}

Check:  and  implement $\frac{1}{(1-x)^2}$.

Graphical reasoning in \mathcal{III}

Check:  and  implement $\frac{1}{(1-x)^2}$.

Graphical reasoning in $\mathbb{I}\mathbb{H}$

Check:  and  implement $\frac{1}{(1-x)^2}$.

Graphical reasoning in $\mathbb{I}\mathbb{H}$

Check:  and  implement $\frac{1}{(1-x)^2}$.

Conclusions

We proposed a categorical environment for signal flow graphs

- compositional semantics in terms of linear relations
- sound and complete axiomatisation
 - graphical proof system

implementation = implementation

specification \Rightarrow implementation

- rich mathematical playground
